Class B Weeds: Non-native species presently limited to portions of the state. Species are designated for control in regions where they are not yet widespread. Preventing new infestations in these areas is a high priority. In regions where a Class B species is already abundant, control is decided at the local level, with containment as the primary goal. Please contact your County Weed Board to learn which species are designated in your area.

Noxious Weeds are non-native plants introduced to Washington state, either deliberately or accidentally through human activities. Because of their aggressive growth and lack of natural enemies in Washington, these plants can be highly destructive, competitive, or difficult to control. These exotic species can be damaging to our economy and natural resources, as they:

- reduce crop yields
- destroy plant and animal habitat
- reduce recreational opportunities (e.g., fishing, hunting, swimming, and hiking)
- clog waterways
- decrease land values
- can poison humans and livestock.

To help protect the state's resources and economy, the Washington State Noxious Weed Control Board adopts a State Noxious Weed List each year (WAC 16-750). This list classifies weeds into three major classes – A, B, and C – based on the stage of invasion of each species and the seriousness of the threat they pose to Washington. This classification system is designed to:

- prevent small infestations from expanding by eradicating them when they are first detected
- restrict already established weed populations to regions of the state where they occur and prevent their movement to uninfested areas
- allow flexibility of weed control at the local level for weeds that are already widespread.
